

Credential Access – Rundll32 KeyMgr

The command was executed to access the Windows Credential Manager using a native system binary.

This technique may expose stored credentials such as passwords and authentication tokens.

The event was identified through the process name and command line, confirming the use of rundll32.exe with keymgr.dll.

The screenshot shows a SIEM query interface. At the top, a KQL query is entered in a text area:

```

1 FROM logs*
2 | WHERE process.name == "rundll32.exe"
3 AND process.command_line LIKE "*keymgr.dll*"
4 | KEEP @timestamp, process.command_line, process.hash.sha256, user.name, host.name
5 | SORT @timestamp DESC

```

Below the query, it indicates "7ms | 1 documents processed". The interface includes a sidebar with "Selected fields" and "Available fields". The main area displays "1 result" in a table format.

@timestamp	process.command_line	process.hash.sha256	user.name	host.name
Apr 23, 2026 @ 23:34:12.508	"C:\Windows\system32\rundll32.exe" keymgr.dll, KRShowKeyMgr	076592ca1957f8f357cc201f0 015072c612f5770ad7de85f87 f254253c754dd7	oolai	asd

The activity was classified as a True Positive due to the suspicious use of a legitimate binary.

The screenshot shows a SIEM alert detail view. On the left, a list of alerts is shown, with the top one selected:

- SL Soc L2 added a comment 2 seconds ago

The main area displays the details of the selected alert:

Description: This detection identifies the execution of rundll32.exe loading keymgr.dll which opens the Windows Credential Manager interface. Adversaries may attempt to access stored credentials using built-in Windows utilities to discover saved usernames and passwords. This behavior may indicate credential discovery activity associated with post-exploitation or lateral movement preparation.

A detection rule was created in the SIEM to identify this behavior.

The rule successfully triggered during testing, validating the detection capability.
