

Lateral Movement Playbook (WMIC Simulation)

Objective:

Simulate and detect lateral movement behavior using WMIC and analyze logs in SIEM.

Attack Command:

wmic process call create "cmd.exe /c whoami"

Execution Steps:

1. Open PowerShell as Administrator
2. Execute the WMIC command
3. Go to SIEM (Discover)
4. Filter the last 5 minutes

Observed Events:

Event 1:

Process: WMIC.exe

Command: wmic process call create "cmd.exe /c whoami"

Event 2:

Process: cmd.exe

Command: cmd.exe /c whoami

Event 3:

Process: whoami.exe

Command: whoami

Process Chain:

WMIC.exe -> cmd.exe -> whoami.exe

MITRE ATT&CK; Mapping:

Tactic: Lateral Movement

Technique: T1047 (Windows Management Instrumentation)

Detection Logic:

process.name: "WMIC.exe"

OR

process.command_line: "**process call create**"

Severity: Medium

Category: Lateral Movement

Tags:

lateral_movement, wmic, process_execution, windows

Analysis:

WMIC was used to create a new process that executed a command shell.

This behavior shows indirect command execution and can hide the original source of the attack.

Conclusion:

This activity simulates how attackers move inside a network using built-in Windows tools.

The detection is based on process behavior and correlation.
